Biofuels recycle carbon dioxide emissions and help protect our environment

Industrial Biotechnology makes conventional ethanol production more efficient

Industrial Biotechnology companies have developed new enzymes and microbes to make biofuels from cellulosic crop residues, waste material and dedicated energy crops

Agricultural Biotechnology companies are developing new energy crops with increasingly positive environmental profiles

Agricultural Biotechnology increases crop yields on each acre of land

According to a McKinsey & Co. estimate, if current corn yield improvement trends continue, zero additional acres will be required to meet the new Renewable Fuels Standard of 15 billion gallons of conventional ethanol
